Review of Systems

**Objective:**

**Vitals:**

04/26/24 1129

BP: 126/78

Temp: 97.4 °F (36.3 °C)

**Physical Exam**

Gen: NAD, awake, alert and oriented

HEENT: Normocephalic, sclera white, cranial nerves grossly intact

Heart: regular distal pulse

Lungs: normal respiratory effort, no cough or wheeze

Right hand:

Isolated 3rd digit swelling with erythema spreading to MCP along 2nd, 3rd, 4th digits dorsal aspect

Motion limited, but some active motion

+ warmth

Discomfort with micromotion

Volar aspect spared

Sensation intact

There is a subtle dark spot along radial side of PIP, no skin opening or drainage

**Images:**

Images from today were independently reviewed by me. No fracture, dislocation, or acute osseous abnormalities.

**Assessment/Plan:**

**Pain**

- XR FINGER RIGHT 2+ VIEWS; Future; Expected date: 04/26/2024

**Cellulitis of right middle finger**

I discussed the nature of his condition. He has cellulitis of the hand mainly affecting the third digit. Does not examine like a tendon infection. I advised he go to the emergency room for an evaluation and antibiotics. Likely will require 24 hours of IV antibiotics to see how he responds.

I contacted the emergency room to let them know. I would recommend a stat MRI to rule out an abscess. Otherwise cellulitis is a condition treated under the medical service. Would be happy to take it orthopedic consult for additional input.

Discussed this case with Dr. O'Brien who is aware and will follow from an orthopedic standpoint if needed.

All questions were answered and patient is in agreement with the plan.

**Physical Exam**

Stanley J Lehman is a 81 y.o. male is alert, oriented, and cooperative with the exam today. Mood and affect is appropriate. On examination of the patient's right foot and ankle there are no skin rashes or lesions. He has no

tenderness over his medial cuneiform and base of first metatarsal as well as over the first tarsometatarsal joint. No other tenderness to palpation of the right foot and ankle. No open wounds. He is able to fire EHL, FHL, gastrocnemius, tibialis anterior, peroneal tendons, posterior tibialis tendon. Sensation is intact light touch in the sural, saphenous, superficial peroneal, deep peroneal, tibial nerve distribution. Palpable DP and PT pulse. Brisk cap refill in all digits.

#### Images:

##### XR FOOT 3+ VW RIGHT

Impression: Three-view weightbearing radiographs of right foot were obtained on 6/17/2024 and reviewed/interpreted by me. Radiographs reveal a displaced and comminuted medial cuneiform fracture as well as base of first metatarsal fracture which is unchanged from previous radiographs. No frank instability noted on the lateral view. No additional fracture, dislocation, or injury.

#### Assessment/Plan:

##### #1 Closed displaced fracture of medial cuneiform of right foot with delayed healing, subsequent encounter (Primary)

- XR FOOT 3+ VW RIGHT

Stanley J Lehman is a 81 y.o. male Who sustained a displaced and comminuted medial cuneiform fracture with disruption of the first tarsometatarsal joint. Due to multiple social constraints we have treated this conservatively. He has done quite well with conservative treatment management. He does not have any significant callus formation and minimal blurring of the fracture line but he is completely asymptomatic. I once again discussed these findings with the patient. He states he is not experiencing any pain and he is working on his farm without any issues. He is now approximately a year from his injury and has done quite well. He will continue to monitor symptomatology. I did offer him a follow-up appointment in another 6 months but he declined. He would like to call my office with any questions, concerns, or issues. All questions were answered. He was in agreement this plan.

Return if symptoms worsen or fail to improve, for right medial cuneiform fracture.

Electronically signed by Shawn M Bifano, MD at 06/17/2024 01:03 PM
